Right. The problem is the imperialism of deep learning pioneers, eg Lecun et al 2015 Nature, which called for replacing "rule-based manipulation of symbolic expressions with operations on large vectors". Such a strident view is antithetical to hybrid models.

Why is this even a discussion. There are entire subfields of AI dedicated to symbolic reasoning... For decades ... Including hybrid approaches with statistical inference... Since at least 1986...

Connectionist imperialism? After half a century of symbolist domination? Seriously?

I don't criticize people for working on approaches that I think are misguided. I work on approaches that I believe in and show results when they work.

This is engineering, good results matter.
